

ICT600 CORRECTED STUDENT EDITION

May 2020 Test 1 Corrected Student Scheme

Corrected, self-contained Test 1 answer reference

Scope	March-June 2020 Test 1
Evidence	Printed question, supplied scheme where available, current lecture notes, and technical verification
Status	Official question and answer audited; invalid HTML/PHP and missing-rate ambiguity corrected

Prepared 26 September 2026

How to use this reference

Teaching-use document

Attempt the original question before revealing this scheme. This corrected edition is not an official UiTM replacement; it records known source errors and accepts equivalent technically correct answers.

- Assessment total: 50 marks.
- Model answers show one defensible solution; alternative correct wording or code may receive full credit.
- For code, method marks remain available when the approach is sound and a minor syntax error does not invalidate the solution.
- Security improvements are shown where historical examples trusted or displayed unvalidated input.

Question 1

Describe Web Browser, Web Server, URL, and HTML.

[8 marks]

Model answer

- Web browser: client software that requests and renders web resources.
- Web server: software/system that receives HTTP requests and returns web responses.
- URL: the address that identifies a resource and how to locate it.
- HTML: the markup language used to structure web content.

Marking guide: 2 marks per accurate function.

Question 2

Identify and explain THREE elements in the supplied HTML.

[6 marks]

Model answer

- Any three valid elements with purpose: html (document root), head (metadata), title (browser/document title), body (visible content), h1 (top-level heading), p (paragraph), or strong (strong importance).

Marking guide: Element (1) + accurate explanation (1), any three.

Correction / moderation note

The printed source uses `<h1>Vision<h1>`. Read the second tag as the intended closing `</h1>`; do not teach the invalid version.

Question 3

Add the UiTM logo with alternative text.

[5 marks]

Model answer

- Use a valid void img element with ASCII quotation marks.

```

```

Marking guide: img element (1), correct src (2), correct alt (2).

Question 4

Explain how JavaScript adds capability to a web document.

[4 marks]

Model answer

- JavaScript can read and change the Document Object Model (DOM), respond to events, validate input, update content/styles, communicate asynchronously, and create interactive behaviour.

Marking guide: DOM/structure relationship (2) + suitable dynamic capability/explanation (2).

Question 5

Include the historical jQuery 1.11.3 CDN file.

[4 marks]

Model answer

- The historically requested statement is shown below.

```
<script src="https://ajax.googleapis.com/ajax/libs/jquery/1.11.3/jquery.min.js"></script>
```

Marking guide: script element (1), src attribute (1), correct path/file (2).

Correction / moderation note

jQuery 1.11.3 is obsolete and should not be the default for new work. Preserve it only as a historical answer.

Question 6

Write changeUSDtoMYR(usd).

[6 marks]

Model answer

- The historical scheme assumes 4.34 MYR per USD, but the question omits the rate. A parameterised function is clearer.

```
function changeUSDtoMYR(usd, rate = 4.34) {  
    return usd * rate;  
}  
const myr = changeUSDtoMYR(210);
```

Marking guide: Function/parameter (2), explicit rate or rate parameter (1), multiplication (2), return (1).

Correction / moderation note

Accept a different defensible rate if stated, because the paper supplied none.

Question 7

Store the printed address in street, city, state, and postcode variables.

[4 marks]

Model answer

- \$street = 'No 10, Jalan Tun Perak';
- \$city = 'Kangar';
- \$postcode = '01000';
- \$state = 'Perlis';

Marking guide: 1 mark per correct variable/value.

Question 8

Display the address across the required three lines.

[4 marks]

Model answer

- Line 1: street; line 2: postcode and city; line 3: state.

```
echo $street . ',<br>';  
echo $postcode . ' ' . $city . ',<br>';  
echo $state;
```

Marking guide: Street (1), postcode+city (2), state (1).

Correction / moderation note

The supplied scheme incorrectly prints postcode plus state on line two.

Question 9

Create printFullName(\$fname, \$lname) but print only the first parameter.

[5 marks]

Model answer

- Follow the explicit instruction and output only \$fname.

```
function printFullName($fname, $lname) {  
    echo $fname;  
}
```

Marking guide: Function name/signature (2), braces/syntax (1), echo first parameter only (2).

Correction / moderation note

The supplied answer omits an opening brace and prints both parameters.

Question 10

Replace Berpuasa with Hari Raya.

[4 marks]

Model answer

- Use str_replace with the search, replacement, and source string in the correct order.

```
$Puasawish = 'Selamat Berpuasa!';  
$Rayawish = str_replace('Berpuasa', 'Hari Raya', $Puasawish);
```

Marking guide: Source assignment (1), str_replace (1), correct arguments/order (2).

Consistency rules

- Award equivalent technically correct syntax and wording.
- Do not reproduce a known historical error merely because it appears in a supplied scheme.
- Keep printed subpart totals fixed unless a documented moderation decision says otherwise.
- For scenario questions, connect the explanation or mitigation to the scenario.
- Record additional accepted alternatives for the next controlled revision.
